As the foundations for the Internet of Services today, the Internet is standing at a crossroads. The Internet has evolved from a source of information to a critical infrastructure which underpins our lives and economies. The demand for more multimedia content, more interconnected devices, more users, a richer user experience, services available any time and anywhere, increases the pressure on existing networks and service platforms. The Internet needs a fundamental rearrangement to be ready to meet future needs. One of the areas of research for the future Internet is the Internet of Services, a vision of the Internet where everything, e.g., information, software, platforms, and infrastructures, is available as a service. Services available on the Internet of Services can be used by anyone if they are used according to the policies defined by the provider and they can be extended with new services by anyone. Advantages of the Internet of Services include the possibility to build upon other people's efforts and the little investment needed upfront to develop an application. The risk involved in pursuing new business ideas is diminished and might lead to more innovative ideas being tried out in practice. It will lead to the appearance of new companies that are able to operate in niche areas.
